

From Company A's side · printing at Company B is an operation inside the Production Work Order

Company A
MAIN ENTITY — OUR ERP
Enquiry, estimation, sales order, procurement, tube manufacturing, packing, dispatch, complaints. Caps and rims are bought ready-made.

Company B
SEPARATE GST — PRINTING
Receives material from A, prints, does printing QC, returns printed material. Not a purchase — an operation inside the PWO.

MODULE FLOW — END TO END

Supporting detail for the module flow

KEY RULES AGREED

- **Product Catalogue is the backbone.** It holds specification, tube dimensions, capacity, laminate structure, BOM, routing, machines, standard wastage, QC parameters, packing, COA requirement, standard costing, version and past complaint / RCA / CAPA history. Selecting a catalogue product auto-fills estimation, BOM, routing and QC plan. A **New / Custom Specification** route exists for products not in the catalogue.
- **Material Requirement lives inside the Production Work Order** — it is a tab, not a separate page.
- **Release is a button on Machine-wise Scheduling** — no separate release screen.
- **The PWO raises the indent automatically** under its own authority. The Purchase Order can only be created **after the indent is approved**.
- **Gate Entry before GRN is optional** — controlled by a setting. If ON, material must be gated in before GRN; if OFF, GRN is made directly.
- **Three mandatory quality gates:** RMQC on incoming material, IPQC during manufacturing (operation-specific, includes printing QC), FGQC **after packing**. No normal dispatch is allowed without FGQC approval.
- **Dispatch sequence is fixed:** Production → Packing → FGQC → Delivery Note → COA → Dispatch.
- **COA** is linked to Customer → Sales Order → Product → Production Order → Batch → FGQC, and carries test parameters, specification, actual results and QC approval.
- **Printing is an operation, not a purchase.** Tracked per transfer: quantity sent, quantity received, good printed quantity, rejection, wastage, unprocessed quantity, printing status, printing cost, delay and the Company B transaction reference.

CROSS-CUTTING — RUNS ACROSS EVERY MODULE

CAPA alert engine

NOT A STANDALONE MODULE

The latest active CAPA / quality control appears automatically as an alert when a relevant transaction is performed. It can be linked to the Product Catalogue, material, supplier, BOM, routing, operation, machine, QC parameter, PWO, packing and dispatch.

A critical CAPA can be configured to block production, material issue, packing or dispatch until the required control is completed. Example: a past shoulder-leakage complaint surfaces that control on the relevant production operation.

Traceability — both directions

NEEDED IF AN RM BATCH IS LATER FOUND DEFECTIVE

Backward: Finished product → Production order → Operations → Raw material → Supplier → GRN → RMQC

Forward: Raw material batch → Production order → Finished product batch → Customer → Sales order → Dispatch

MODULE → PAGE MAP

MODULE	PAGES	QTY
Product / Engineering	Product Catalogue, Item Master, Process & Routing Master, Machine Master, Customer / Vendor Ledger, QC Parameter Master, Artwork Master	7
Sales	Enquiry, Estimation, Quotation, Sales Order	4
Planning	Production Work Order (<i>BOM + material requirement + auto indent</i>), Machine-wise Scheduling (<i>+ release</i>)	2
Purchase / Inventory	Indent Approval, Purchase Order, Gate Entry (<i>optional</i>), GRN, Stock & Batch Tracking, Material Issue	6
Manufacturing	Production Entry, Printing Send to Company B, Printing Receipt & Reconciliation, WIP / Job Floor Status	4
Quality	RMQC, IPQC, FGQC, COA, NCR	5
Dispatch	Packing, Delivery Note, Dispatch & Invoice, Sales Return	4
Costing	Actual Costing & Variance	1
Complaint / CAPA	Customer Complaint, RCA, CAPA & Closure	3
Dashboard / Reports	Management dashboard, module reports	2
Total	Mockup screens to be built	38
